

MARKETING PLAN · MY FIRST NINETY DAYS

Thirty, sixty, ninety Building the engine

What the marketing stack looks like today, what I would build on it, and how that turns into a scored list of gas-fired accounts on three sellers' desks every week.

BRAD SEBASTIAN

DIGITAL MARKETING & BUSINESS DEVELOPMENT

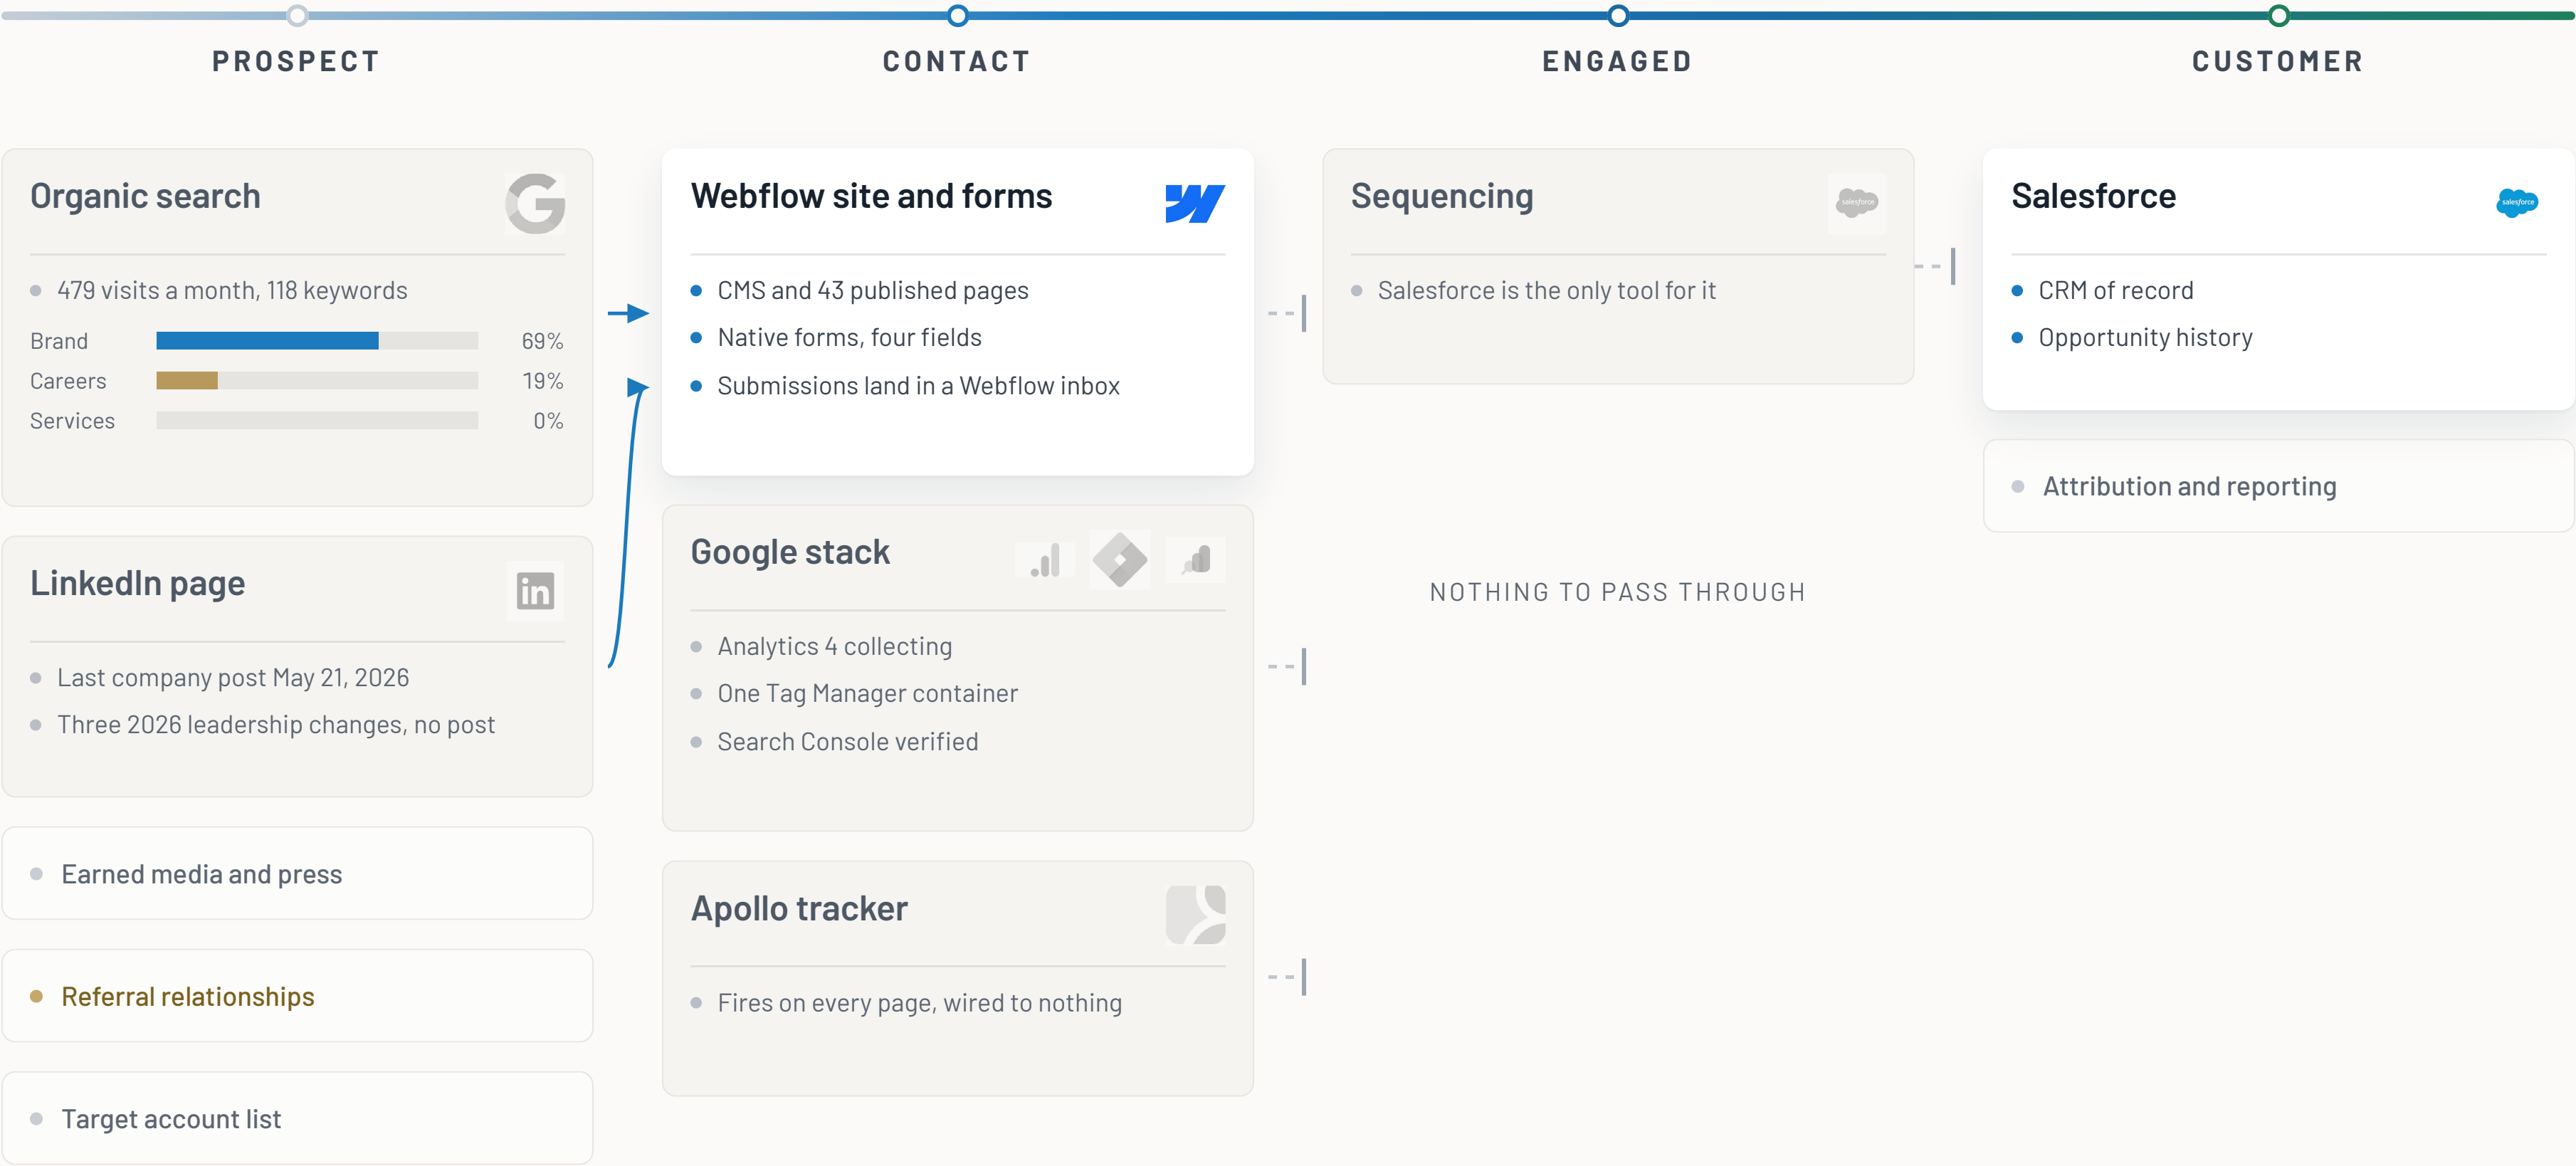

Prepared for Michael Morrow

September 2026

NOTE TO MICHAEL

Michael, here's the strategy doc we discussed at the end of our meeting on Wednesday. On some of the hard facts in this I made some assumptions and leaned a little bit on AI for some of the research input. But this is the framework on how I would build the engine and implement a new marketing strategy for EverLine.

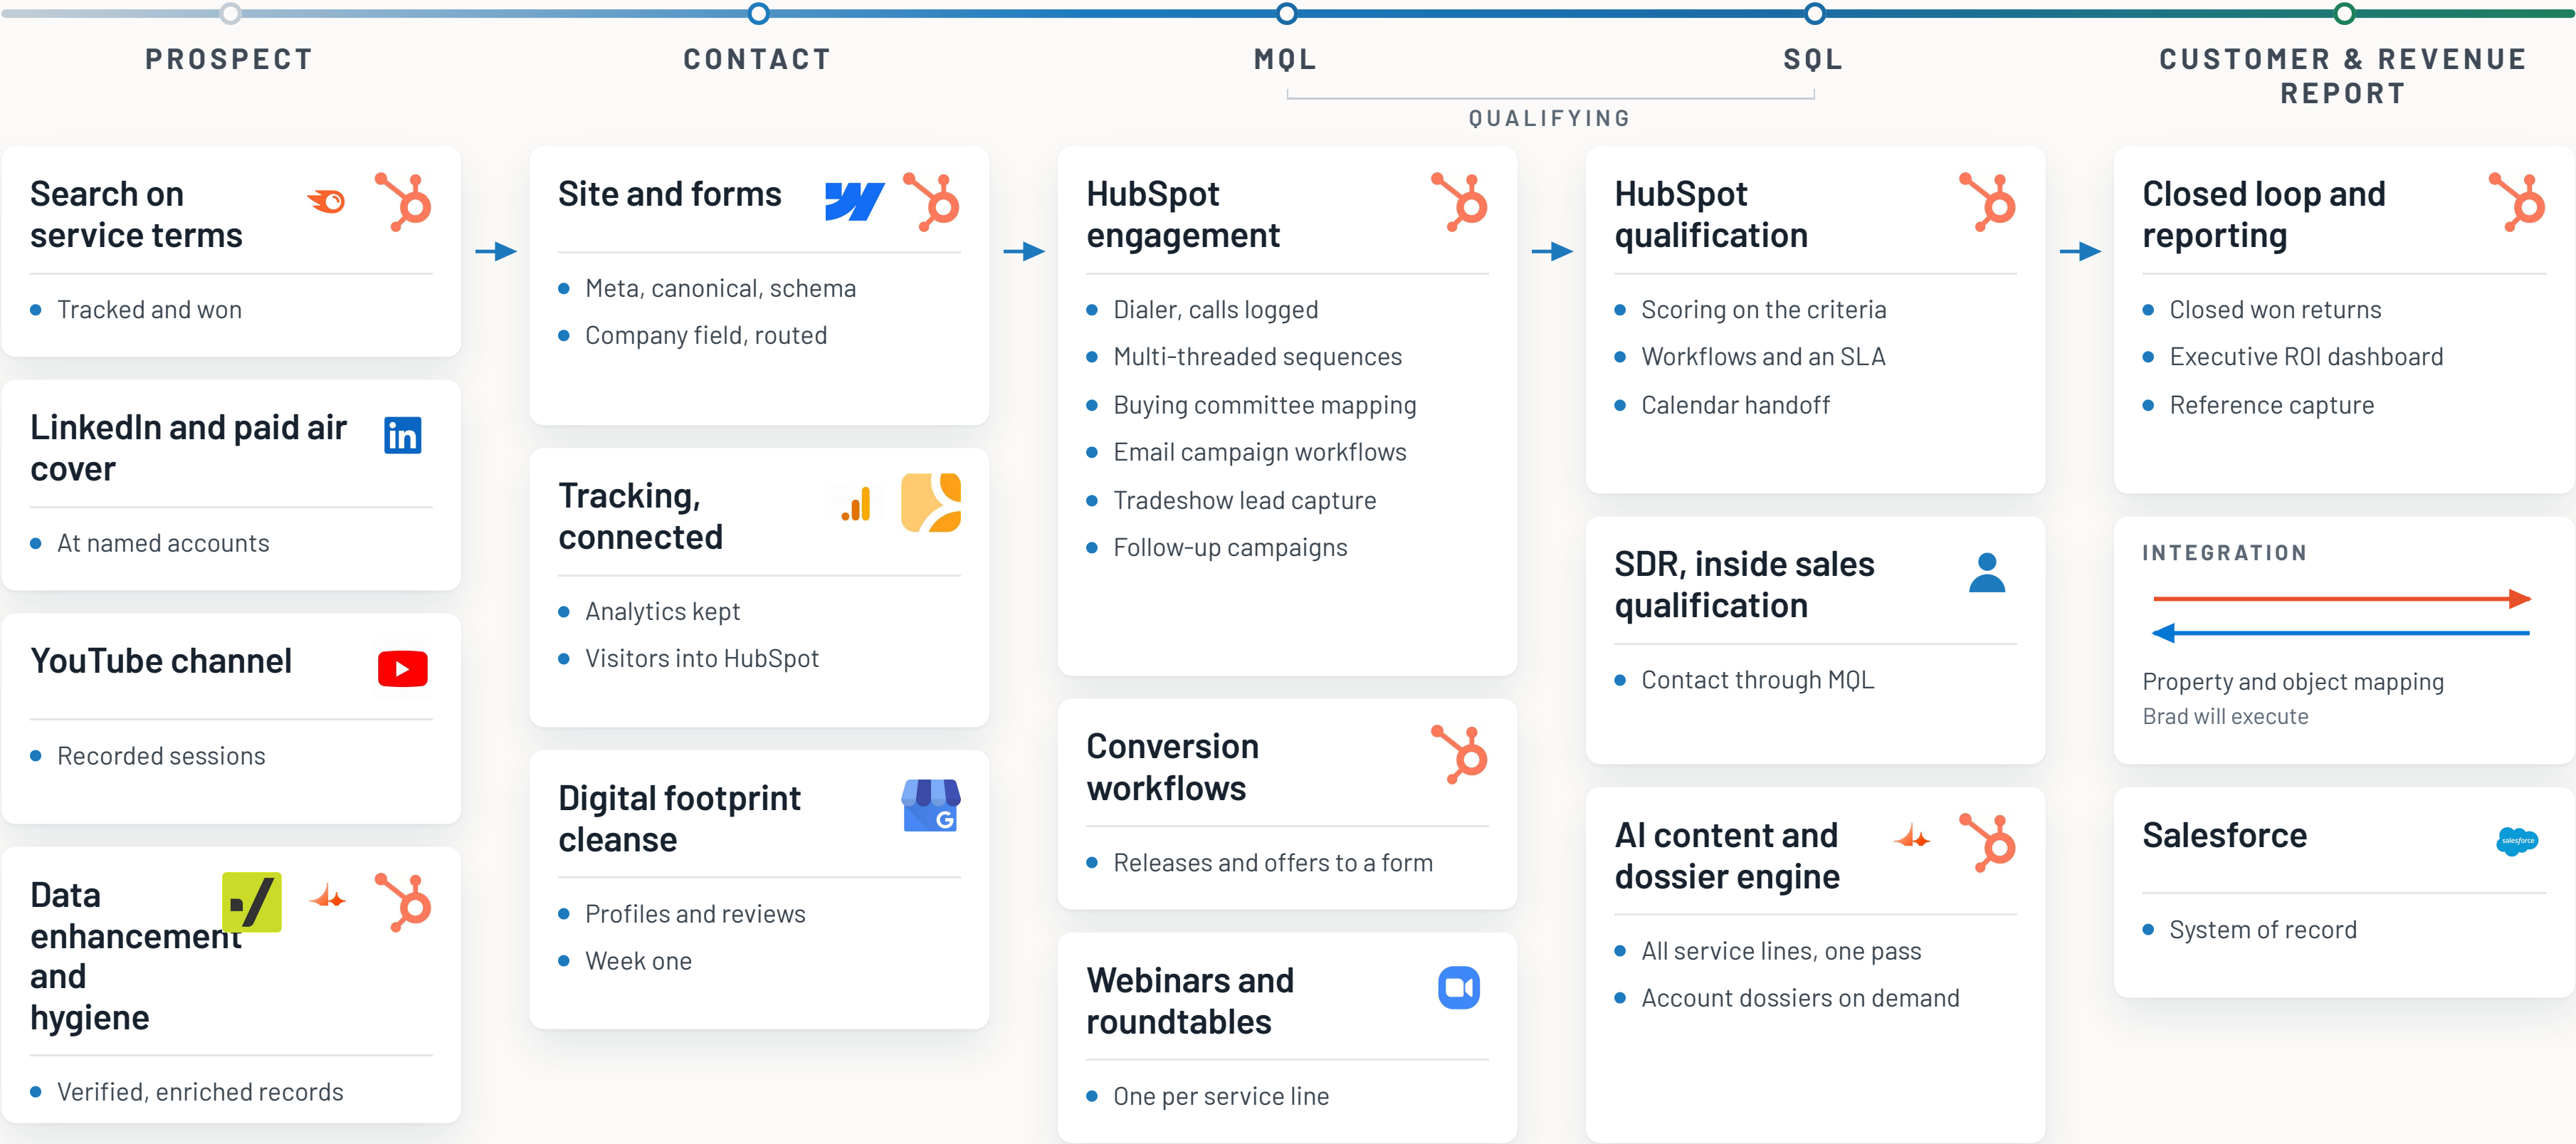

Current MarTech Stack & Findings

NOTE TO MICHAEL

I took the liberty of looking under the hood on the website and doing some research on what the digital footprint looks like in terms of your public facing digital profile, to help me put together this slide.

Proposed MarTech Stack & Pipeline

NOTE TO MICHAEL

In a perfect world, this is what it would look like. This is very high level and obviously doesn't include everything. A lot of these things fit in different buckets, but these are the bigger pieces. You'd mentioned that Wes might be brought in to help build out the MarTech stack. Of course, that would be pretty awesome. I talk to Wes all the time and we've worked together for years, so that handoff would be a no brainer.

Every keyword sending traffic is a brand term or a job posting

Of the ten keywords sending the most traffic, four are the company name and six are careers pages.

21	479	118	0	0
AUTHORITY SCORE	ORGANIC VISITS A MONTH	RANKING KEYWORDS	SERVICE TERMS IN THE TOP TEN	CITATIONS IN AI SEARCH

TOP TEN KEYWORDS BY TRAFFIC

	KEYWORD	VISITS	SHARE
1	everline brand	212	48.29%
2	everline brand	49	11.16%
3	safety manager careers page	45	10.25%
4	everline houston brand	32	7.28%
5	pipeline technician careers page	14	3.18%
6	pipeline controller jobs careers page	11	2.50%
7	everline tech brand	9	2.05%
8	safety manager job description careers page	7	1.59%
9	pipeline controller careers page	7	1.59%

Semrush, US database, September 9, 2026. The free tier shows the top ten.

WHAT THAT COSTS

An operator searching for what EverLine sells does not find EverLine

- No ranking for third party control room operator, SCADA control center outsourcing, NERC compliance services, PHMSA consulting, pipeline integrity or OT security. **Certrec, RCP, Trinity, ENTRUST and TRC publish into all of them.**
- The brand term is not theirs either.** On the query EverLine, everlineus.com ranks eighth, behind a Lake Tahoe resort and a pavement marking franchise. On EverLine US the site does not appear at all.
- Zero mentions and zero cited pages across ChatGPT, Gemini and AI Overviews.** A buyer researching through an assistant never sees the name.
- 273 referring domains and 754 backlinks already exist**, mostly from press releases. None of that authority points at a service page.

NOTE TO MICHAEL

So when I looked under the hood, I just ran a quick Semrush. I know SEO isn't really what drives this type of sales cycle, but it took like fifteen seconds, and I figured it does matter. This is what it kicked out, and some of the assumptions are made from this. It helped kind of drive the rest of the deck.

Finding the gas-fired targets and ranking them

Power generation is the growth segment and gas-fired is the priority inside it. This is how that target list gets built, scored, and handed to the three sellers in order.

Why these accounts are worth more

The synergy you described

- An operator with a gas plant and regulated pipe can buy more than one line
- The fuel lateral runs under 49 CFR 192, enforced by PHMSA interstate and by the Railroad Commission in Texas
- Above the BES thresholds the plant registers with NERC as a Generator Owner and Operator
- Two obligations, one relationship, all four lines in play

Where the list comes from

Sugar Land, and I know the platform

- **Industrial Info Resources.** Plant records with owner and operator, unit capacity, fuel type, capital projects, planned outages and named contacts
- Their separate midstream database covers the pipe side of the same operator
- NERC public registration data for functions held and region
- Whatever win and loss history Salesforce holds, by service line

Where I would start*

In this order, for this reason

- 1 **Customers already buying one line.** They own assets in a segment nobody has sold them. Needs a Salesforce export and an hour with each seller, nothing else.
- 2 **Dual-asset operators.** The overlap above. Highest value in the model and the hardest for anyone else to take.
- 3 **New Category 2 registrants.** Solar, wind and storage registered May 15, 2026. Inverter-based only, so no gas and no pipe.

GETTING IT INTO THE CRM AND ONTO THE DOSSIER

SOURCE

IIR API or nightly file

- REST API for live queries
- FTPS drop for bulk refresh
- Python and C# samples published

BUILD

A small sync service

- Matches IIR records to HubSpot companies
- Runs nightly, no manual touch
- This is the part I would write

CRM

HubSpot company properties

- MW on site, fuel type, plant count
- Owns regulated pipe, yes or no
- Capital project or outage in 12 months
- NERC functions held

PRIORITY

Scoring and tiering

- Those fields drive the score
- Tiered list refreshed monthly
- Signed by the three sellers

OUTPUT

Dossier and call list

- Plant and project detail assembled at call time
- Ranked list, delivered weekly
- Slide 7 covers what is on it

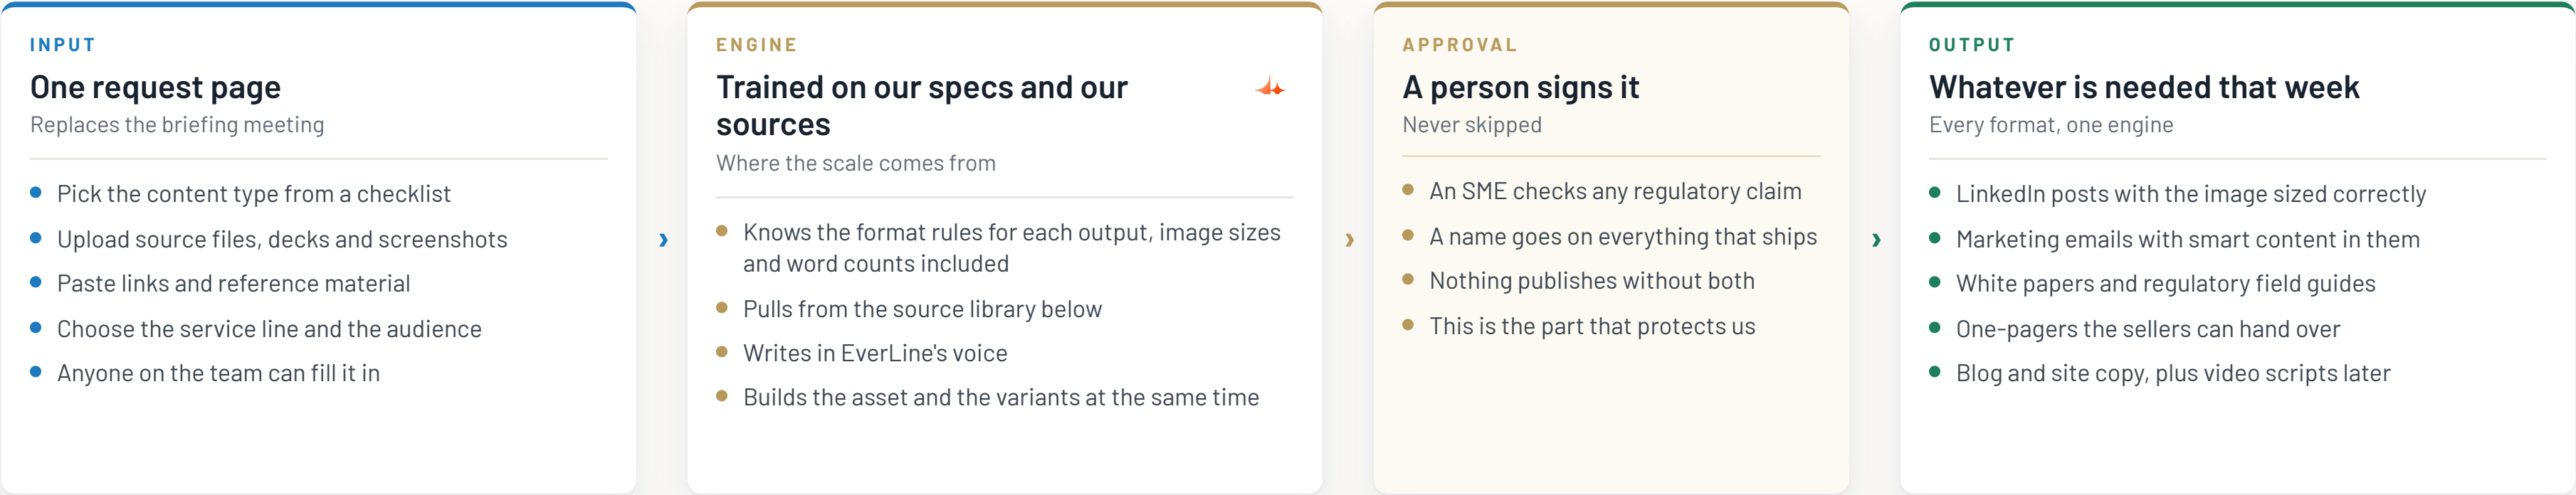

* **Segments two and three came out of AI-assisted research, not from inside the building.** Treat them as a starting position. Segment one needs no research at all, which is why it goes first. What is mine is the method, the scoring model and the build. There is no off-the-shelf IIR connector, for HubSpot or Zapier or Salesforce, so this is a build. Custom objects need one Enterprise seat, and Smart CRM Enterprise provides that for \$75 a month and unlocks them account-wide.

NOTE TO MICHAEL

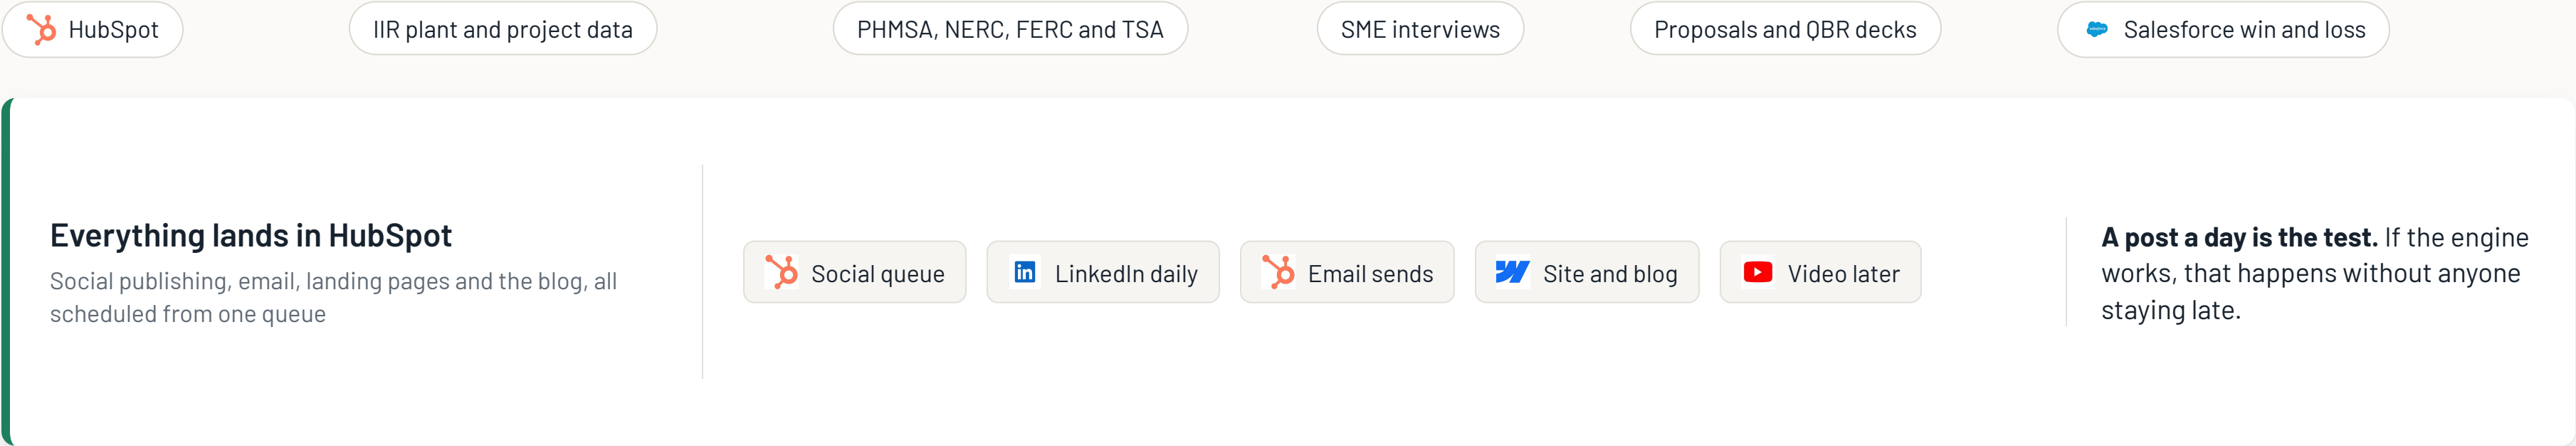

You said gas-fired power gen is the segment you most want to grow, so I ran some research on it and put together how I'd segment that market and go after it. This one leans on AI research and I've marked the part that does. The half I'd stand behind is the bottom. Industrial Info Resources is a platform I know, and getting that data into HubSpot so it actually drives scoring is the kind of build I'd just go do.

Automated content creation engine

Daily publishing across all service lines takes more production than hand-writing allows. The engine scales the output. A person still approves everything before it ships.

THE SOURCES IT READS FROM

NOTE TO MICHAEL

This is an AI piece that would be a real cornerstone for the entire MarTech stack and something that would really allow us to supercharge the entire marketing program. What is on the slide is a hypothetical of what it might look like. It would let us scale content creation and get us up to speed on all the things that make the digital marketing pinwheel start to spin really fast.

Redundancy, reliability, ROI

One request on the Connect control room, and what comes back. The copy below is built from EverLine's own published language and an SME interview.

WHAT GOES IN

The request

TOPIC

Outsourced control room operations. Answer the hesitation operators have about handing over asset operations.

SOURCES PULLED

- The Connect page, in its own words
- Redundancy spec: hardware, networks, generator, primary and secondary data centers, DR site
- Over 50 operators, 15 states and offshore
- Tested in more than 15 federal and state audits
- SME interview with the control room manager

AUDIENCE

Director of Operations, VP Operations, and the CFO on the cost case

MARKETING EMAIL

DRAFT · AWAITING SME

SUBJECT

What happens to your control room at 2am on Christmas

Preview: redundant hardware, redundant networks, and fifty operators already awake

Most operators keep the control room in house because the room was never the problem. The staffing behind it is. Coverage at two in the morning, on a holiday, the week a controller resigns.

EverLine runs fully redundant hardware and software, redundant networks, a dedicated backup generator, and primary and secondary data centers. Over fifty operators across fifteen states.

Run the coverage math on your operation

Smart content swaps the opener by segment

WEBSITE ARTICLE

DRAFT · AWAITING SME

CONNECT

What redundancy costs, and what it costs to skip it

Every operator running a control room already pays for redundancy. Most pay for one layer of it and call that covered.

Where the single points of failure hide

One data center, one network path, one generator, and a roster that assumes nobody quits in December.

What a fully redundant room actually has

Redundant hardware and software, redundant networks, a dedicated generator, primary and secondary data centers, and a disaster recovery site.

The number that decides it

Cost per covered hour against the fully loaded cost in house.

Built for the terms an operations director actually searches

COMPANY PAGE POST

DRAFT · AWAITING SME

EL EverLine

Energy's Technical Stack · 1h

Air traffic control for pipelines is the shortest way to describe what our control room does.

The question we always get is what happens when something fails. Fully redundant hardware and software. Redundant networks. A dedicated generator. Primary and secondary data centers.

Over 50 operators, 15 states and offshore, tested in more than 15 federal and state audits. Redundancy is the product.

FEDERAL AND STATE AUDITS

24×7

EVERY DAY OF THE YEAR

BUILT FOR CONTINUOUS OPERATION

- Fully redundant hardware and software, and redundant networks
- A dedicated generator for power backup
- Primary and secondary data centers, and a disaster recovery location
- Cyber and physical security protocols underneath all of it

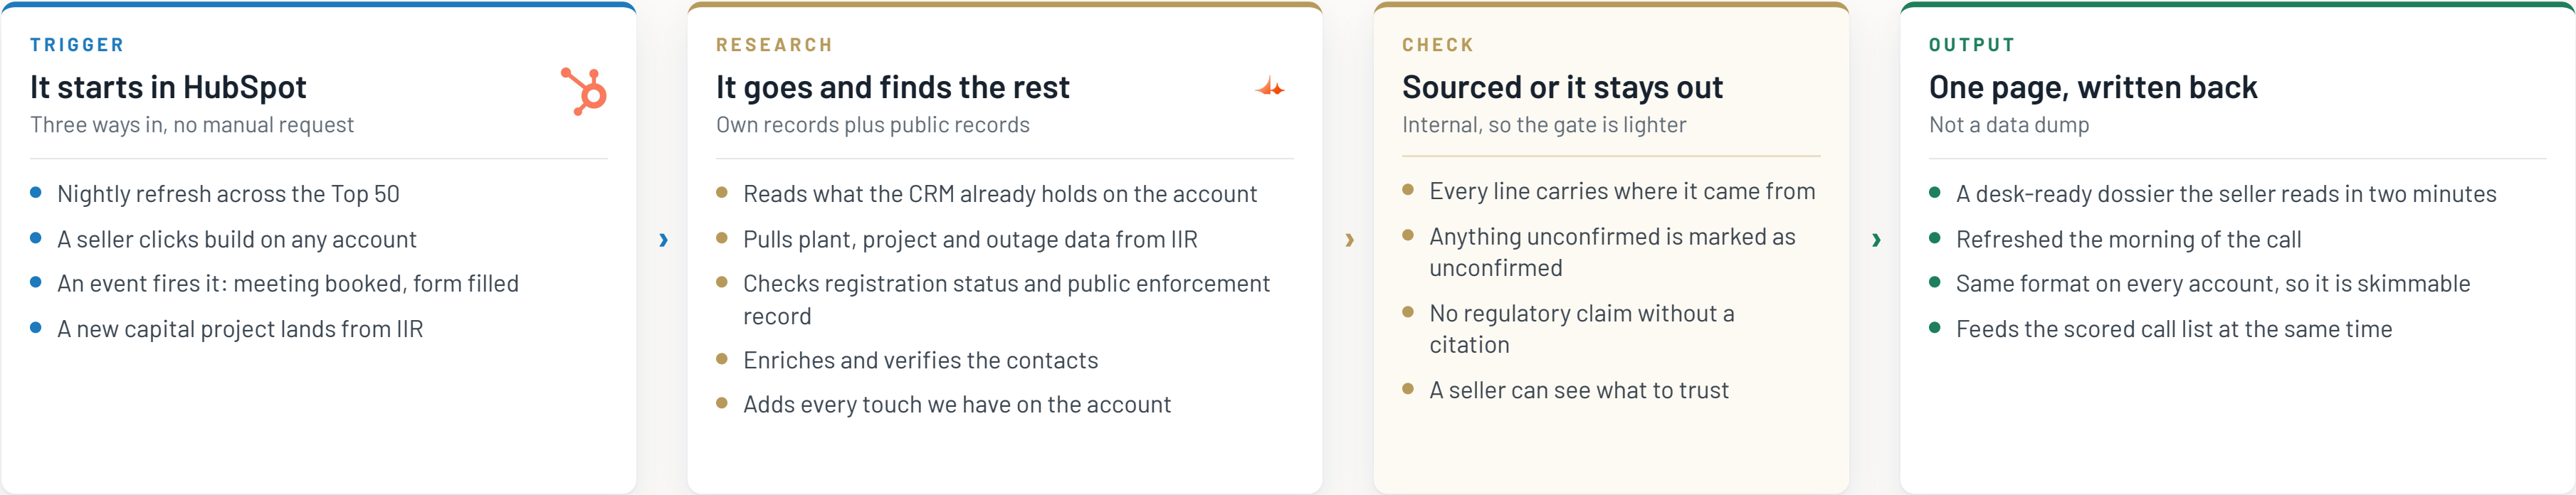

Leave-behind, sized for print and for email

NOTE TO MICHAEL

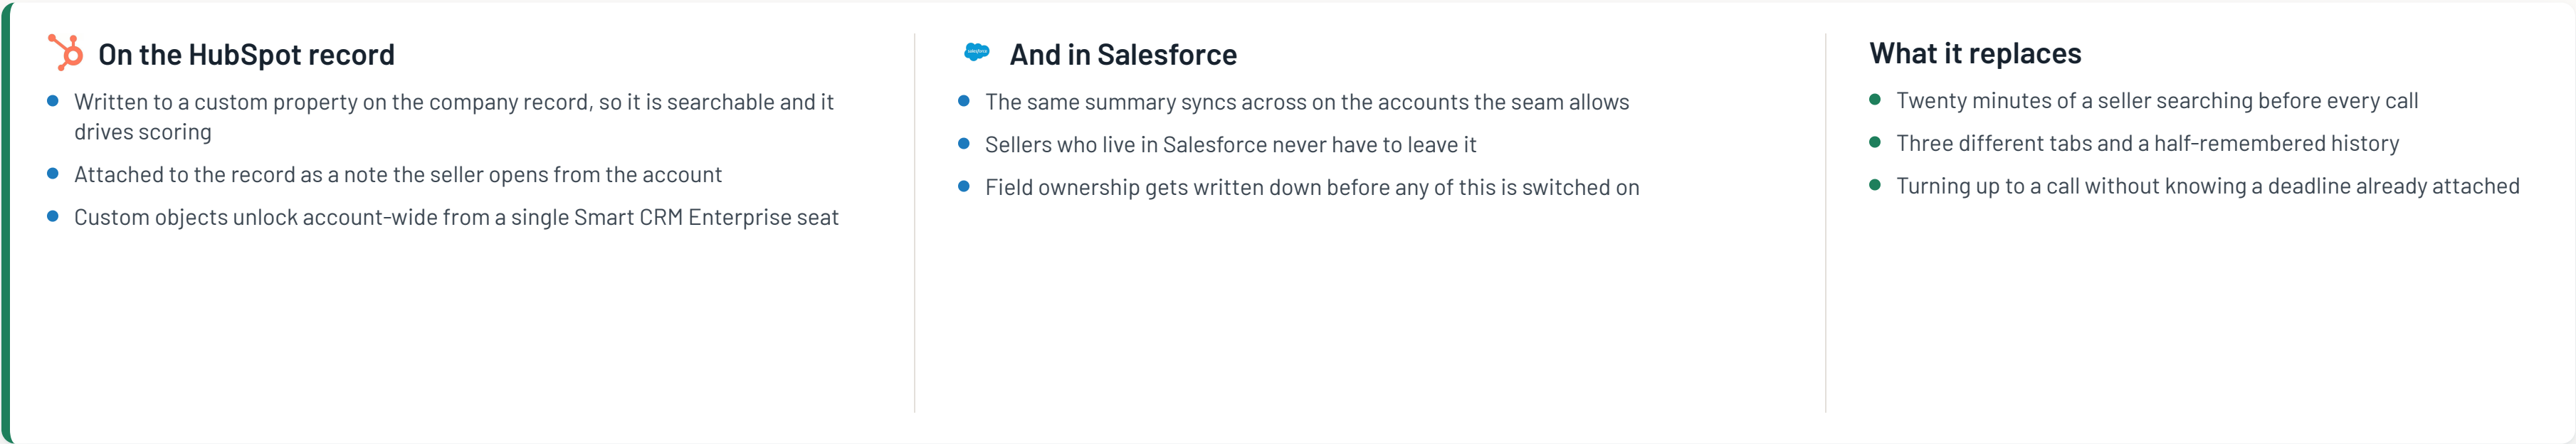

This is an example of what it would actually output. I actually ran this piece and the subject matter was how the asset management piece works, which is the part we talked about on Wednesday. Between that conversation and the AI engine's own background research, this is what the output was. So I am presenting this as an example. This is something we can build to scale outputs every day.

Automated account dossier engine

The same build, pointed at accounts instead of content. It reads the CRM record, goes and researches the company, and writes a desk-ready page back onto the record.

WHERE THE DOSSIER ENDS UP

NOTE TO MICHAEL

This is the same build as the content engine, just pointed at accounts. It starts from the HubSpot record, goes and does the research on the company, and writes a finished page back onto the record so it is there before your guy opens the account. If I can get the Salesforce side wired the same summary lands there too.

What a seller opens before the call

A manufactured account, built to look like the hard ones. Every block below is one the engine fills and keeps current on the company record.

WHAT GOES IN

The trigger

A meeting gets booked on a Top 50 account. The dossier builds overnight and is on the record before the seller opens it.

WHAT IT READS

The HubSpot record and every touch on it

IIR plant, unit, project and outage data

NERC registration and functions held

PHMSA enforcement and incident record

Salesforce history, including why we lost

TIME TO PRODUCE

Overnight and unattended. On demand it takes about a minute.

Everything on the right is invented. It is written as a hard account on purpose: an incumbent in place, a buyer who blocked us before, and a buying window nobody is watching.

THE OPENING LINE

“Your Bexar turbine upgrade is scoped for the spring. That outage is when you decide who carries the control room and the evidence trail behind it for the next five years, and I want to show you what that costs per covered hour.”

NEXT BEST OFFER

The control room economics benchmark, so they run their own number before we quote one.

Update dossier

Open in Salesforce

Flag a correction

Every field is editable. Corrections feed back into the scoring.

NOTE TO MICHAEL

This is a manufactured client and a manufactured output that I created with my imagination as an ideal scenario, but I look forward to the opportunity to actually make something like this, because it would be a super powerful thing for the sales team.

Silver platter leads

Tangible, workable outcomes for every rep. Everything else in this plan is machinery built to produce these.

A scored call list

Who to call, in order

- Ranked, so the top of the list is the next call
- Rebuilt continuously as the signal changes
- The same list marketing and sales both see
- No argument about which name is worth the hour

Warm leads

Somebody who moved first

- Engaged with something real, not a list buy
- Scored past a threshold sales agreed to
- Inside a buying window we can point at
- Sourced here, so we know what they read

Booked meetings

On the calendar, with context

- Qualified before it reaches the calendar
- The reason for the meeting attached to it
- Held by the SDR until the seller takes it
- Rescheduled by us if it slips

Completed dossiers

The account, on one page

- Everything needed before they dial
- Built from public record and our own data
- Refreshed the morning of the call
- One page, never a data dump

Inside the dossier

The same ten fields on every account, so a seller can skim it

- **Asset footprint.** Plants, MW, miles of regulated pipe, interconnect voltage
- **Rulebooks that apply.** NERC and which region, PHMSA or the state agency, TSA
- **Live deadline.** What has already attached and what is coming, with the date
- **Who signs.** Named, with the budget they control
- **Who blocks.** Named, and why they have said no before

- **What they buy today.** From us, and from whoever else is in the account
- **Public record.** PHMSA enforcement, inspections, incidents. NERC findings are not public
- **Why we lost before.** Straight out of Salesforce
- **Every touch we have.** Content read, emails opened, pages visited
- **Anything unconfirmed.** Marked as unconfirmed, so the seller knows what to check

Worked example on the previous slide

Then the two lines that matter most: **the opening line**, written for that account, and **the next best offer** to put in front of them.

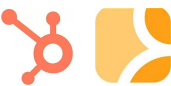

NOTE TO MICHAEL

This is the slide I probably care about the most. This is what all the other components in the marketing engine actually produce, and it is what the sales guys can use to go out there and grow the business. This is where the vanity stats become tangible, useful things that help the business grow.

An SDR is key to optimizing marketing automation

A qualifying outbound inside sales rep provides tremendous value to any marketing automation program. Here is what the role does and where it fits in the engine.

What the role does

Outbound, and the front end of inbound

- Works the scored list first thing, every day
- First touch on tier one and tier two accounts
- Qualifies against criteria sales agrees to up front
- Books meetings straight into the three sellers' calendars
- Logs disposition on every attempt, which is what keeps the data honest

Why automation needs one

The part of the loop software cannot close

- **Scoring only pays off when somebody works the output.** A high score nobody calls is a report
- **Disposition notes are the training data.** Right reason, wrong timing, wrong person is what tunes the model
- **Speed decides conversion.** An inbound worked in minutes behaves differently from one worked in days
- **Nurture needs a human exit.** Automation carries an account to interested and no further

Where it sits

One seat, in the middle

- Between the engine and the three sellers
- Working the same list marketing scores
- In HubSpot, so every attempt is on the record
- Feeds the weekly engagement review
- Closers stay on closing

How it gets measured

Numbers from the first month

- Meetings booked and held, per seller, per week
- Dossier to meeting conversion on tier one and two
- Time from first engagement to first conversation
- Pipeline created from marketing-sourced accounts
- Scoring accuracy, which improves as disposition data builds

RECOMMENDATION

Add one inside sales seat

Inside the first quarter

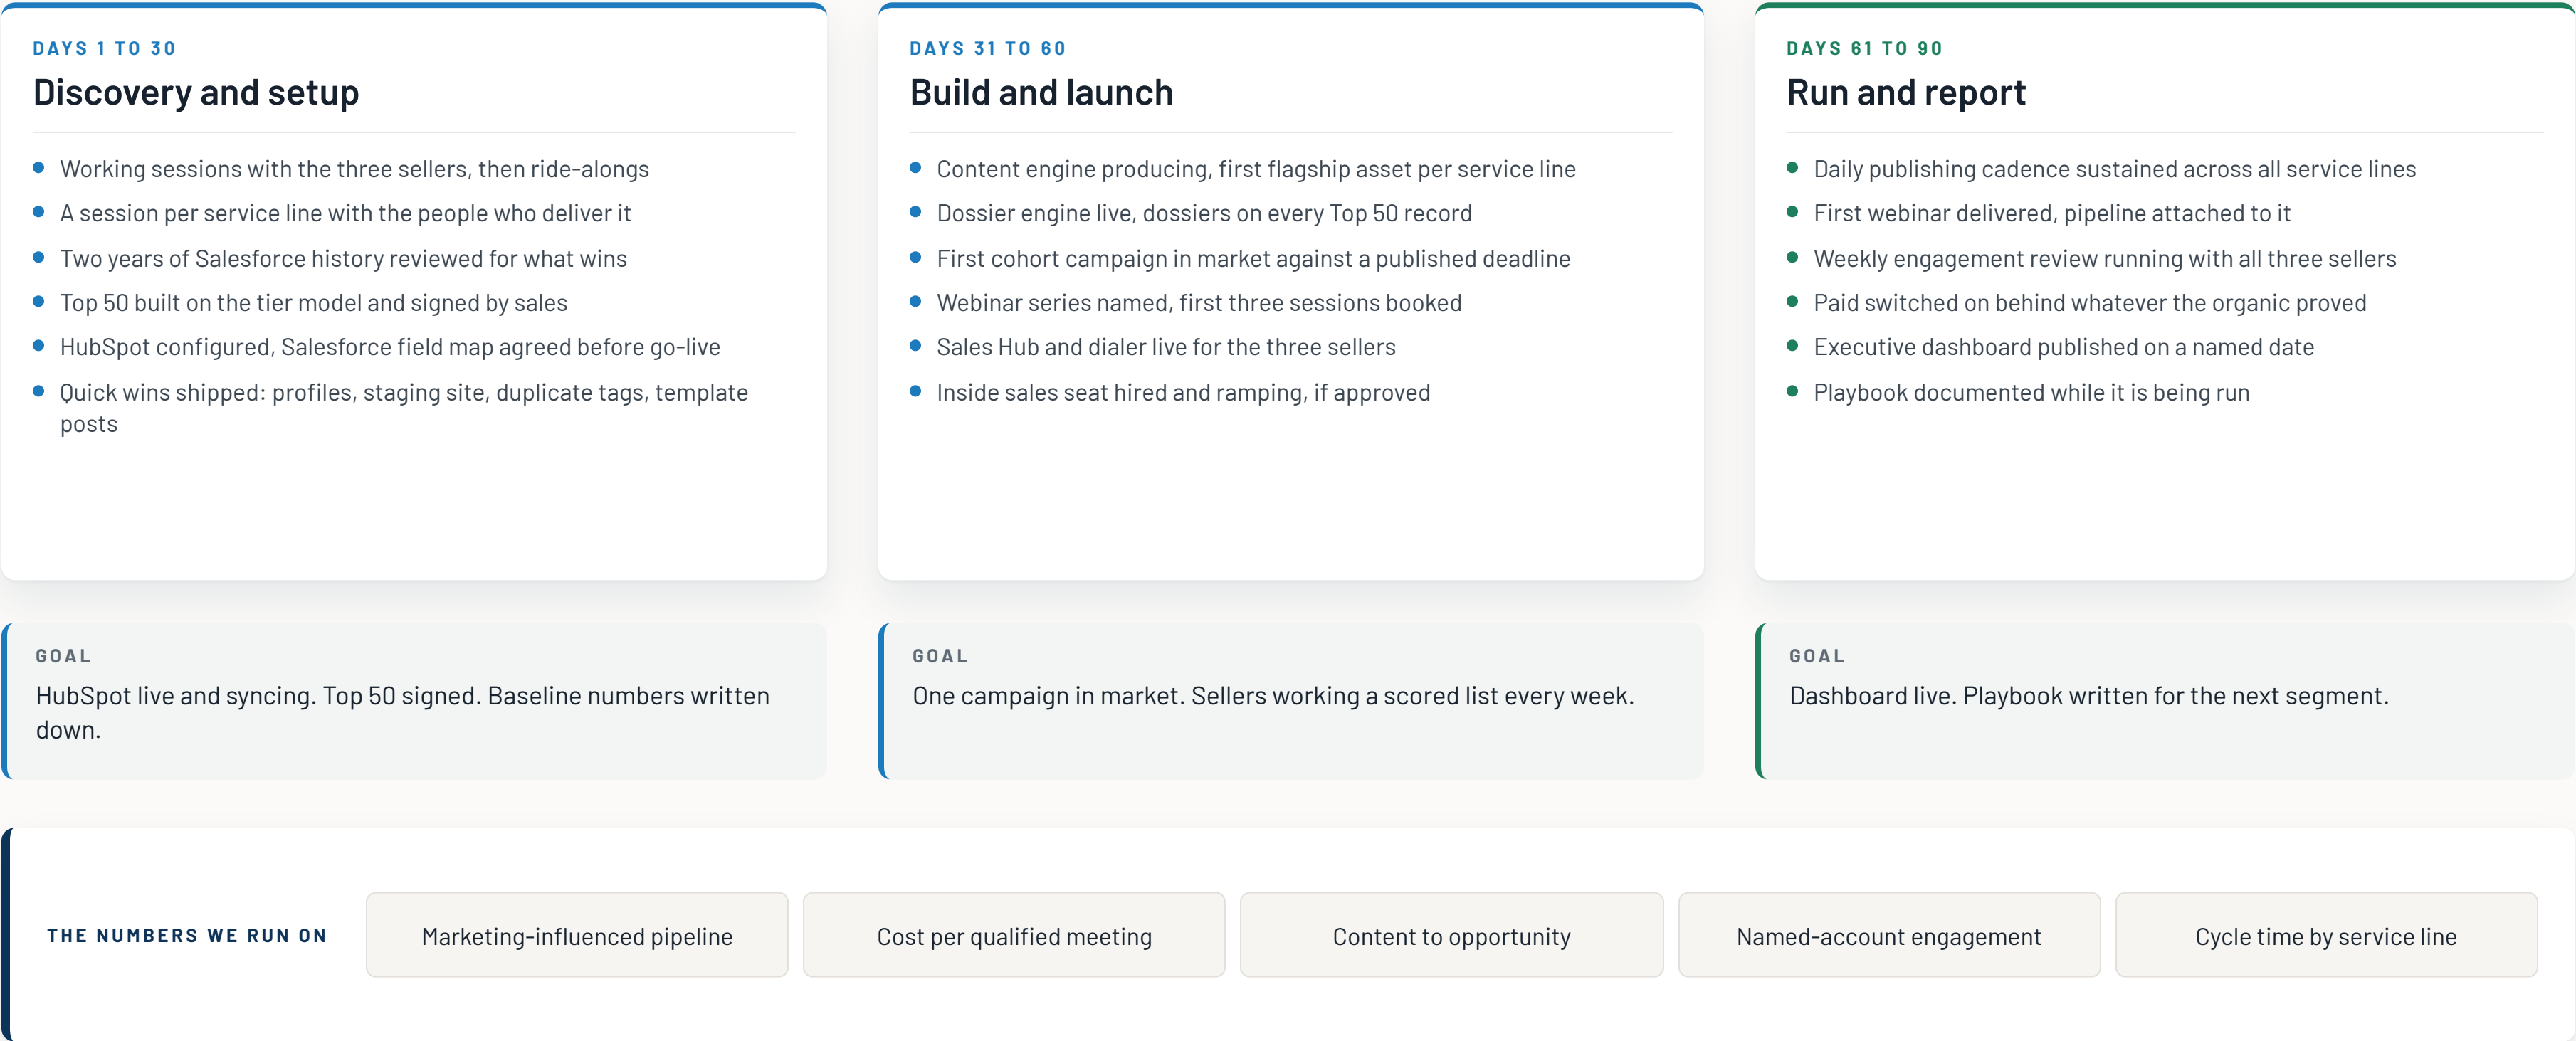

- I would write the role and run the hire
- Reporting line is yours to decide
- I have built and run this motion before
- Ramp and scoring loop are mine to manage
- Costed with you once the volume is real

NOTE TO MICHAEL

If there is room for some headcount, an SDR or an inside salesperson really helps drive the engine. I know the automation can work without it, but this piece really gets it going, and I am happy to hire and manage this resource. I have experience in that.

Thirty, sixty, ninety

What ships in each block, and the goal each one has to hit. The tools and the engines behind these are on the slides above.

NOTE TO MICHAEL

Here's the summary of all of it on a thirty, sixty, ninety timeline.

Cost estimates and AI disclosure

The full stack, priced. Every line carries a number, nothing has been quoted yet, and no line gets bought before there is a process using it.

ITEM	PER MONTH
HubSpot Customer Platform Professional All five hubs at Pro, 5 core seats. \$490 cheaper than buying the hubs separately	\$1,300
Industrial Info Resources Estimate, not a quote. Subscription plus data access, scoped in discovery	\$1,500 to \$4,000
LinkedIn Ads \$25 a day. The floor where an ABM campaign on 50 to 100 accounts produces readable data	\$750
Apollo Three to ten seats at published list. Already running on the site today	\$360 to \$1,200
HubSpot marketing contacts, 5,000 block 2,000 contacts does not cover a company this size	\$250
Demio webinar platform 500 registrants. Registration pages run in HubSpot	\$184
Semrush, SEO plan 5 sites and 500 tracked keywords, billed annually	\$117
HubSpot Smart CRM Enterprise, 1 seat Cheapest door to custom objects. Unlocks them account-wide	\$75
Claude and OpenAI API Mid-tier model for volume, flagship for the hard 20 percent, batch pricing overnight	\$75
Sentry Error monitoring on a pipeline that runs at 2am with nobody watching	\$26
Supabase Pro Managed Postgres with backups behind the two engines	\$25
GitHub Copilot Business, 1 seat License control and IP indemnity on generated code	\$19
Fly.io One always-on app and database. Also runs the nightly job	\$10
GitHub Team, 2 users Private repos and 3,000 Actions minutes a month	\$8
Scheduled nightly jobs GitHub Actions cron. A 20 minute job uses 600 of the 3,000 included minutes	\$0
Vercel Deploys onto the Fly instance already budgeted	\$0
HubSpot to Salesforce integration Native. The cost is configuration time	\$0
Salesforce Sales Cloud Already owned. No migration, no new spend	No change
Webflow Already owned	No change
Google Analytics 4, Tag Manager, Search Console All three already in place	\$0
Google Business Profile and Bing Places Four offices, not one listing claimed today	\$0
LinkedIn page, YouTube, Glassdoor, Indeed None of them claimed or running today	\$0

REFERENCE TOTAL \$4,700 to \$8,040 a month, plus \$3,000 one time for HubSpot onboarding. Roughly \$59K to \$99K in year one, including media.

Published list prices as of September 2026, before any volume or annual discount, and nothing above has been quoted. The two ranges are estimates. HubSpot onboarding is the most negotiable line in the table and is waived if a certified partner implements instead. Headcount is excluded.

AI DISCLOSURES

Tooling. Claude (Anthropic) for source retrieval, research synthesis and first-pass drafting. Claude Design for artboard template, type scale and layout. No third-party content was reproduced.

Site and tag audit, 10 Sep 2026. Automated inspection of everlineus.com: rendered DOM, HTTP response headers, robots.txt, sitemap.xml (43 URLs). Platform identified as Webflow, site id 63a5d6e46df355b689eac62a, x-wf-region us-east-1 behind Cloudflare. Tag inventory: GTM-P85XG09; GA4 G-M0352S03ED; LinkedIn Insight partner IDs 6105522 and 4938676, loading both insight.min.js and the retired insight.old.min.js; Apollo website tracker; LiveIntent did-0091 with idex, sync-container and rp sync chain; DoubleClick ccm and stats collect. Form handling: native Webflow, id wf-form-contact, no action attribute, no captcha, no third-party handler detected. Meta description and rel=canonical present on the homepage only. Zero application/ld+json across sampled pages. Zero lastmod values in sitemap.xml.

Search data. Semrush US database, retrieved 9 Sep 2026. Domain Overview and Organic Research Positions, free tier, top ten rows returned. Authority Score 21, 479 monthly organic sessions (estimate), 118 ranking keywords, 273 referring domains, 754 backlinks, zero paid keywords, zero AI-search citations across the four surfaces Semrush tracks. Traffic figures are third-party estimates and are not measured analytics.

Regulatory figures. NERC IBR Registration Initiative work plan filing to FERC, 29 Apr 2026: 531 Category 2 IBR facilities and 449 entities as of 20 Apr 2026, of which 322 are first-time registrations. Registration derives from Rules of Procedure revisions approved by FERC 27 Jun 2024 in Docket RR24-2, running alongside Order No. 901 standards development. Category 2 applies to non-BES inverter-based resources at aggregate nameplate 20 MVA or greater connected at 60 kV or greater; synchronous generation is out of scope. Eight standards attached 15 May 2026. PRC-029-1 and PRC-030-1 carry an effective date of 1 Oct 2026 in NERC's table; that table assigns no Category 2 compliance date for either, and both are inverter-based ride-through standards that do not reach synchronous generation. Source: NERC Reliability Standards Compliance Dates for GOs and GOPs.

Company statements. everlineus.com service pages retrieved 10 Sep 2026 and quoted as published, including the control room redundancy specification, over 50 operators, 15 states and offshore, and more than 15 federal and state audits. NERC Transmission Operator certification, EverLine Tech Ops LLC, SERC jurisdiction, final report 1 Oct 2025. All such claims are EverLine's own and are unaudited by this document.

Vendor pricing. Vendor-published pricing pages retrieved 11 Sep 2026. Where a vendor publishes no list price the figure shown is a range estimate, labeled as such. Industrial Info Resources is the largest such line and the one most likely to move. Four items could not be confirmed and are carried as open questions for procurement: whether HubSpot Smart CRM Enterprise must be licensed on one seat or all core seats; the exact hub composition of the Customer Platform Professional bundle; whether HubSpot calling minutes are per account or per seat; and GitHub year-two renewal rates, which GitHub does not publish. HubSpot restructured during 2026: Operations Hub is now Data Hub and Smart CRM is sold standalone, which is why custom objects no longer require a Marketing Hub Enterprise upgrade.

Generated content. The three market segments on slide 5 are AI-generated from public data and are a hypothesis to be tested in discovery, not a validated list. The account on slide 7b is fictional and generated for illustration. All sample copy on slide 6b is draft and is shown pre-approval.

AI skills used. Purpose-built skills written by Brad Sebastian and invoked in producing this document: handoff, which packages a brief and its source material for a separate working session; reference-appendix, which assembles this page, the cost table and these disclosures. Claude Design was used for the artboard template, type scale and slides 1 to 4. Both form part of a larger set of custom skills maintained for research, drafting, review and delivery workflows.

Agentic review. Four independent review passes were run in parallel against the finished draft and their corrections applied before this version: a hiring-manager perspective read; a readability and authorship audit computing Flesch Reading Ease, Flesch-Kincaid, Gunning Fog, sentence-length variance, n-gram repetition and bullet-structure uniformity; an adversarial fact-check against primary regulatory sources; and a vendor pricing verification. Two errors in the regulatory content and one in pricing scope were identified and corrected by those passes.

Limitations. AI-assisted research can contain errors, omissions and stale figures. Figures are traced to primary sources where cited. Nothing in this document was obtained from inside EverLine. Where any figure conflicts with EverLine internal data, the internal figure is correct.

NOTE TO MICHAEL

This is a slide I put at the back of any deck I make. I use a skill I created that automates pulling the references and the costs and shows where things came from, including the AI disclosures. Pretty handy one, and it builds this page for me.
